DOCUMENT-IDENTIFIER: US 20020078194 A1

TITLE: Resource management and billing system for a broadband
satellite communications system

----- KWIC -----

Application Filing Date - APD (1):

20001220

Detail Description Paragraph - DETX (31):

[0051] The interface established between the service manager and the billing system allows for satellite configuration and activation, as well as communication and synchronization of satellite terminal information between service management and billing. This is desirable because rate plans are typically based on the definition of services an NSP has purchased for the satellite terminal. In addition, service level agreements document the **quality of services** purchased by the NSP. Service level agreements usually cover a variety of issues, including throughput and availability. **Performance** to a set **criteria** defined by the service level agreement is measured and may result in credits to an account. The billing system will compare service level agreement **criteria** against actual **performance** so that appropriate adjustments can be made. Credits and other processing relating to **performance** against a service level agreement are documented as part of a rate plan within a billing system.

TITLE: Dynamically adaptive network element in a feedback-based data network

----- KWIC -----

Detailed Description Text - DETX (116):

Each of the business application plug-ins utilized by the monitor system 262 may be used to evaluate a specific set of characteristics of the network. For example, monitor system 262 may be used to evaluate **performance criteria** of the various network elements to determine whether the service **quality provided by the service** provider conforms with the standards set forth in a Service Level Agreement (SLA) established between the service provider and the end user or consumer. Alternatively, using different plug-in applications, monitor system 262 may be used for **performance** monitoring, billing, configuration management, security violation reporting, fault management, etc. Moreover, different plug-in applications may run concurrently to allow monitor system 262 to analyze different aspects of the network simultaneously.
